#### FOREST FLORA OF NICHLAUL—IV. TREES

### S. K. SINGH AND S. N. DIXIT

University of Gorakhpur, Gorakhpur

#### ABSTRACT

This paper enlists the trees found in Nichlaul forest, Gorakhpur Division (U.P.). Geographical limits, topography, edaphic and climatic factors of the area, its vegetational composition, injurious factors, phenological behaviour of the common plants and an artificial key to the families as well as to the species are given. In all, 109 tree species belonging to 91 genera and 44 families are included, giving field observations, local names, habit, habitat, dominance and sociability. Flowering and fruiting seasons as well as collection numbers of plants are indicated.

#### INTRODUCTION

There have been a few noteworthy contributions on the flora of Gorakhpur during recent years (Sen, 1959, 1960; Dixit et al. 1968; Sahai and Sinha 1968; Gupta, 1969). However, these are concerned with the herbaceous angiosperms of the area. Panigrahi and Saran (1967) reported 102 woody species during their floristic studies on the entire Gorakhpur Forest Division. Sharma et al. (1969) confined their studies to pteridophytes only during their exploration of the forests of Gorakhpur Division.

During the course of intensive study (1966-69) the authors collected 203 woody species from the Nichlaul forest of Gorakhpur Division. The present paper, IV in the series\* of Forest Flora of Nichlaul, deals only with the trees of this forest. In all, 109 species belonging to 91 genera and 44 families have been reported chiefly on the basis of field observations. Information on local names, habit, habitat, dominance and sociability have been given. Flowering and fruiting seasons as well as collection numbers of

plants, have been indicated. An artificial key to the species has been prepared based mainly on the vegetative characters under two groups A. and B.—A. dealing with plants having compound leaves and B. having simple leaves. The collected specimens have been deposited in the Herbarium, Botany Department, University of Gorakhpur, Gorakhpur.

### GEOGRAPHICAL LIMITS

The forests of Gorakhpur Division are situated in Maharajganj, Pharenda and Sadar Tehsils of Gorakhpur district. They lie between lat. 26°42′ and 27°25′ N and long. 83°13′ and 83°52′ E.

Nichlaul forest which contains very rich vegetation and remains unexplored so far, has been selected for the present investigation. The forest under study lies 91 km north-west of Gorakhpur in Maharajganj Tehsil and is adjoining the foot-hills of Nepal-Himalaya. The total area is about 5,231.78 ha. The average altitude of the area is about 99.77 m.

#### **TOPOGRAPHY**

The land surface is apparently a level tract sloping gently from north-west to south-east. A remarkable feature of its land-scape is the total absence of any hill or hillock. The forest is mainly intersected by

<sup>\*</sup> Forest Flora of Nichlaul-I. Herbaceous plants. Indian For. 1972 (In press).

Forest Flora of Nichlaul-II. Shrubs and climbers. Bull. bot. Soc. Bengal, 1972 (In press).

Forest Flora of Nichlaul-III. Phytosociological studies. Bull. bot. Surv. India 13: 180-186. 1971.

the river Little Gandak which drains the entire area. Due to recent construction of Gandak canal, the drainage of the forest has been badly impeded resulting in the submergence of the area for about four months every year. Besides, there are many tals, nullahs and low lying areas which remain inundated during and for some months, after the rains.

#### SOIL

The soil is composed of Gangetic alluvium. Since much of the ground is liable to inundation, the particles deposited are very fine. In most places the soil is of heavy texture, although the banks of the river have soil of a coarser nature as the heavier silt gets deposited there. The subsoil, mostly of land clay, is poorly aerated with little thickness of loam at the surface. Beneath this, at depths varying from a few to six meters or more, there is usually a deposit of pure sand (Tiwari, 1965).

### CLIMATE

The average rainfall is about 1200 mm. The monsoon rains commence during June (2nd-3rd week) and come to an end in September but may persist till October. From October to May, there is usually a prolonged dry weather with only scanty winter rains. The hot weather commences in March and lasts till the rains set in. The minimum temperature goes down to 6°C in the month of January and maximum rises upto 43°C in the month of June.

### VEGETATION

The forest abounds in trees, shrubs and woody climbers. The herbaceous flora is poor during rainy season due to the inundation of forest ground. The vegetation of the area is almost of moist deciduous type. However, some of the trees are evergreen and semi-evergreen. Most of the trees shed their leaves at the beginning of the cold season while others during the hot summer months. The forest is thickest during rainy season.

Following Champion and Seth (1968), the forest under study may be categorised as under:

- (A) Eastern heavy alluvium sal.
- (B) West Gangetic moist deciduous forest.
- (C) Seasonal swamp forest.
- (D) Low alluvial savanna woodland.
- (A) Eastern heavy alluvium sal: This occupies about one-third of the entire forest. The principal species is Shorea robusta Gaertn. f. which grows gregariously. The sal trees in this area somewhat vary in height, stocking and quality. The undergrowth is generally poor except along the edges of the depressions and in grasslands.

The forest can easily be distinguished in three stories. The top storey is composed of Adina cordifolia (Roxb.) Benth. & Hook. f. ex Brandis, Bombax ceiba Linn., Bridelia retusa Spreng., Dalbergia sissoo Roxb., Dillenia pentagyna Roxb., Diospyros exsculpta Buch.-Ham., Lagerstroemia parviflora Roxb., Lannea coromandelica (Houtt.) Merr., Terminalia alata Heyne ex Roth and T. chebula Retz. Climbing over the top of the trees, are the gigantic climbers like Acacia rugata (Lam.) Merr., Butea parviflora Roxb., Capparis zeylanica Linn., Combretum roxburghii Spreng., Erycibe paniculata Roxb., Zizyphus rugosa Lamk. etc.

The middle storey is constituted by Aegle marmelos (Linn.) Corr., Anthocephalus chinensis A. Rich. ex Walp., Butea monosperma (Lam.) Taub., Careya arborea Roxb., Cassia fistula Linn., Croton roxburghii Bal, Dalbergia lanceolaria Linn. f., Dillenia pentagyna Roxb., Ehretia laevis Roxb., Embelia tsjeriam-cottam A. DC., Holarrhena antidysenterica A. DC., Kydia calycina Roxb., Mallotus philippensis (Lam.) Muell.-Arg., Miliusa tomentosa (Roxb.) J. Sinclair, Schleichera oleosa Oken, Semecarpus anacardium Linn. f., Spondias pinnata Kurz, Xeromphis spinosa (Thunb.) Keay. The common climbing plants on these trees are: Capparis zeylanica Linn., Cissampelos pariera Linn., Dalbergia volubilis Roxb., Dioscorea bulbifera Linn., Hemidesmus indicus R. Br., Porana paniculata Roxb., Stephania japonica (Thunb.) Miers, Zizyphus oenoplia (Linn.) Mill.

The third storey consists of shrubby undergrowth of Ardisia solanacea Roxb., Baliospermum montanum (Willd.) Muell.Arg., Carissa opaca Stapf, Clerodendrum indicum (Linn.) O. Kuntze, C. viscosum Vent., Glycosmis mauritiana (Lam.) Tanaka, Grewia rothii DC., Leea edgeworthii Santapau, Murraya koenigii (Linn.) Spreng., Pogostemon benghalense (Burm.) O. Kuntze, Solanum erianthum D. Don and Zizyphus nummularia (Burm. f.) Wt. & Arn. The undergrowth is very dense along the grassy depressions and is composed of Ardisia solanacea Roxb., Carissa opaca Stapf, Ficus heterophylla Linn. f., Glycosmis mauritiana (Lam.) Tanaka, Phragmites maxima (Forsk.) Blatt. and Solanum erranthum D. Don. Elsewhere it is generally light and consists of Clerodendrum indicum (Linn.) O. Kuntze, C. viscosum Vent., Grewia rothii DC., Murraya koenigii (Linn.) Spreng. etc.

Northern portion of the sal forest is interrupted by grassland dotted with trees and shrubs like Adina cordifolia (Roxb.) Benth. & Hook. f. ex Brandis, Aphanamixis polystachya (Wall.) Parker, Bombax ceiba Linn., Carissa opaca Stapf, Casearia elliptica Willd., Holarrhena antidysenterica A. DC., Mallotus philippensis (Lam.) Muell.-Arg., Mimosa himalayana Gamble, etc. The chief climbers found over trees and shrubs of this open grassy area are Acacia rugata (Lam.) Merr., Combretum roxburghii Spreng., Dalbergia volubilis Roxb., Zizyphus oenoplia (Linn.) Mill.

At places where soil is loamy and well drained, patches of teak plants are seen amongst the sal. The ground vegetation in such areas is poor. The chief associated shrubs are Carissa opaca Stapf, Clerodendrum viscosum Vent., Pogostemon bengha-

lense (Burm.) O. Kuntze and Streblus asper Lour.

(B) West Gangetic moist deciduous forest: This occupies the North-west portion of the Nichlaul forest. It contains luxuriant teak crops. The chief associates are: Albizzia lebbeck (Linn.) Benth., Alangium salvifolium (Linn. f.) Wang., Careya arborea Roxb., Casearia elliptica Willd., Cassia fistula Linn., Citrus medica Linn., Ficus racemosa Linn., F. religiosa Linn., F. semicordata Buch. Ham., Mallotus philippensis (Lam.) Muell. Arg., Miliusa tomentosa (Roxb.) J. Sinclair, Streblus asper Lour. The rim of teak forest is occupied by Ailanthus excelsa Roxb.

The teak forest is completely deciduous during April-June excepting some evergreen trees and shrubs e.g. Alangium salvifolium (Linn. f.) Wang., Citrus medica Linn., Ficus religiosa Linn., Mallotus philippensis (Lam.) Muell.-Arg., Miliusa tomentosa (Roxb.) J. Sinclair and Streblus asper Lour.

The undergrowth of teak is quite poor. The prominent shrubs scattered in the area are Carissa opaca Stapf, Clerodendrum viscosum Vent., Pogostemon benghalense (Burm.) O. Kuntze, Streblus asper Lour. Besides, much of the ground is occupied by teak saplings. Climbers are totally absent.

(C) Seasonal swamp forest: The swamp forest occurs in low-lying areas which remain inundated during and for some months after the rains. This is chiefly located along the river, Little Gandak. The soil of this area usually consists of fine clay and is very rich in humus. Some of the characteristic species found in this area are: Adina cordifolia (Roxb.) Benth, & Hook. f. ex Brandis, Alangium salvifolium (Linn. f.) Wang., Alstonia scholaris (Linn.) R. Br., Aphanamixis polystachya (Wall.) Parker, Ardisia solanacea Roxb., Bischofia javanica Blume, Calamus tenuis Roxb., Celtis tetrandra Roxb., Cordia dichotoma Forst. f., Drypetes roxburghii (Wall.) Hurusawa, Ficus benjamina Linn. var. comosa King, F. heterophylla Linn. f.,

multiloculare Voigt, Grewia Glochidion disperma Rottl. ex Spreng., Kirganelia reticulata (Poir.) Baill., Litsea glutinosa (Lour.) C. B. Robins, Pongamia pinnata (Linn.) Pierre, Salix tetrasperma Roxb., Syzygium cumini Skeels, Vitex negundo Linn., Woodfordia fruticosa (Linn.) Kurz, etc.

The most conspicuous climbers are Ampelocissus latifolia (Roxb.) Planch, Argyreia sericea Dalz., Bridelia stipularis Blume, Cissus adnata Roxb., Clematis gouriana Roxb. ex DC., Ichnocarpus frutescens R. Br., Ipomoea muricata (Linn.) Jacq., Mallotus repandus Muell.-Arg., Rivea hypocrateriformis Choisy, Stephania japonica (Thunb.) Miers, Tiliacora acuminata (Lam.) Miers, Tinospora cordifolia (Willd.) Miers, etc.

(D) Low alluvial savanna woodland: This type occurs on the higher and more stable alluvial terraces. Such a forest is characterised by an assemblage of large number of species. Prominent trees forming the upper storey in this area are: Albizzia procera (Roxb.) Benth., Bombax ceiba Linn., Dalbergia sissoo Roxb., Ficus racemosa Linn., Lannea coromandelica (Houtt.) Merr., Tectona grandis Linn. f., Wendlandia heynei (R. & S.) Steud.

The middle storey consists of Acacia catechu Willd., Ailanthus excelsa Roxb., Aphanamixis polystachya (Wall.) Parker, Callicarpa arborea Roxb., Emblica officinalis Caertn., Flacourtia indica Merr., Garuga pınnata Roxb., Gmelina arborea Roxb., Terminalia bellirica (Gaertn.) Roxb., Trewia Benth., polycarpa Xeromphis spinosa (Thunb.) Keay.

Most common shrubs and climbers are: Alangium salvifolium (Linn. f.) Wang., Ampelocissus latifolia (Roxb.) Planch., Ardisia solanacea Roxb., Calamus tenuis Roxb., Cissus adnata Roxb., Colebrookia oppositifolia Smith, Murraya koenigii (Linn.) Spreng., Polyalthia suberosa (Roxb.) Thw., Pogostemon benghalense (Burm.) O. Kuntze, Solanum torvum Swartz, Tiliacora acuminata the entire northern forests were submerged,

(Lam.) Miers, Ventilago maderasputana Gaertn.

The common grasses found in this area Apluda mutica Linn., Phragmites maxima (Forsk.) Blatt. & McC., Saccharum spontaneum Linn. Some of the interesting dwarf species found in this localities are: Careya herbacea Roxb., Combretum nanum Buch Ham. ex Don, Grewia sapida Roxb.

# FACTORS INJURIOUS TO THE VEGETATION

### I. Climatic:

- (a) Drought: Damage to the vegetation by drought is insignificant in the area of present investigation. Only sporadic drying of trees may be observed in dry years. However, considerable damage by drought has been reported in 1907 and 1908 when the district had annual rainfalls as low as 714 mm and 933 mm (Tiwari, 1965).
- Frosts are not a normal fea-(b) *Frost*: ture in Gorakhpur forests, because the temperature remains almost uniform throughout the year and in winter season it seldom falls below o°C. However, fairly severe frost occurred in the year 1905, 1925 and 1933 to 1937 which badly affected the young crops of sal (Tiwari, 1965).
- (c) Storms: Intense heat for a few days during summer is generally followed by wind-storms and occasional light showers. The intensity is seldom so high as to uproot the sal stands but breakage of twigs and branches by wind is common, particularly in the young teak plants. The worst damage from this source is the destruction of sal flowers and fruits which are of vital importance for regeneration
- (d) Floods: The river, Little Gandak, often comes down in flood and plays havoc in the area. The river often changes its course washing away large tracts of forest bearing alluvial soil.

During the year 1961, due to sudden spill of water of the Great Gandak, practically the depth of water being upto 5 m at places (Tiwari, 1965).

## II. Fire:

On the whole, damage by fire is slight. In sal areas, severe fires are not common, but on a hot windy summer day considerable damage may be done by fire to the young crops resulting in a great setback in growth and even the older crops may suffer. In the non-sal areas, fires are more frequent and may occasionally cause considerable damage to the young plants, otherwise they are not of much importance.

### III. Biotic:

- (a) Plant climbers: The forest is infested with a large number of climbers which cause great damage to valuable timber trees. Some of the most common climbers that affect the young trees and shrubs are: Acacia rugata (Lam.) Merr., Butea parviflora Roxb., Capparis zeylanica Linn., Combretum roxburghii Spreng., Erycibe paniculata Roxb., Milletia auriculata Baker, Tiliacora acuminata (Lam.) Miers, Ventilago maderaspaiana Gaertn.
- (b) Fungi: The root fungus—Polyporus shoreæ is a serious pest and kills many sal trees, usually in groups in the moist areas near 'tals' and depressions etc.
- (c) Wild animals: Pigs, 'nilgai' and wild cattle do some damage by browsing of young shoots. Monkeys and baboons also cause great damage by destroying the flowers and fruits of the plants, particularly Alangium salvifolium (Linn. f.) Wang., Shorea robusta Gaertn., Terminalia bellirica (Gaertn.) Roxb. etc. and receptacles of Ficus racemosa Linn.
- (d) Domestic animals: The forests are particularly liable to damage from illicit grazing as they are surrounded by a dense population which maintain large herds of cattle, for which there is, at certain seasons of the year, little sustenance outside the forests.

The injury is greatest to the young plants along the borders as the cattle are attracted by their succulent leaves.

(e) Man: Continuous collection of twigs and branches of trees and shrubs by villagers for fodder and fuel causes great damage to the plants.

# PHENOLOGICAL BEHAVIOUR OF GMMON PLANTS

The periodic behaviour of plants in relation to the various phases of their life cycle is termed as phenology. Thus, the germination, vegetative growth, flowering and fruiting of plants in relation to time period are some aspects of phenology. Information regarding the phenological behaviour is useful in determining the proper time for seed collection and in proper evaluation of silvicultural problems.

The phenological aspects of the tropical vegetation was first studied by Schimper (1903). Blatter (1906-1907) presented an interesting correlation of the flowering time with the climate in different parts of the country. Richard (1932) summarised most of the available information on the subject. The phenological behaviour of a few species of New Forest, Dehra Dun has been studied by Krishnaswamy and Mathuda (1954). Koelmeyer (1959) investigated the periodicity of leaf change and flowering in the principal plant communities of Sri Lanka. Gupta (1960, 1967) has made certain phenological observations on the flora of Naini Tal and Mussoorie hills.

In the present investigation a correlation of the flowering of some selected species with foliage condition has been studied.

Flowering commences with the leaf fall: Butea monosperma (Lam.) Taub.

Madhuca longifolia (Koenig) Mac Bride var. latifolia (Roxb.) Chev.

Ougeinia oojeinensis (Roxb.) Hochreut.

Flowering commences when the tree is completely nude; the new foliage appears only after the flowering has been completed:

Alangium salvifolium (Linn. f.) Wang. Bombax ceiba Linn.

Erythrina indica Lam.

26. Samydaceae 25. Lythraceae

Garuga pinnata Roxb.

Lannea coromandelica Merrill

Spondias pinnata Kurz

Flowering commences after leaf fall with new foliage:

Adina cordifolia (Roxb.) Benth. & Hook. f. ex Brandis.

Albizzia lebbeck (Linn.) Benth.

A. procera (Roxb.) Benth.

Careya arborea Roxb.

Cassia fistula Linn.

Dalbergia lanceolaria Linn. f.

Emblica officinalis Gaertn.

Gmelina arborea Roxb.

Holarrhena antidysenterica Wall. ex DC.

Lagerstroemia parviflora Roxb.

Miliusa tomentosa J. Sinclair

Mitragyna parvifolia Korth.

Oroxylum indicum Vent.

Schleichera oleosa (Lour.) Oken.

Terminalia alata F. Heyne ex Roth.

Flowering commences while the mature leaves are present on the plant. Majority of the plants fall under this category. Some of the common species are:

Bridelia retusa Spreng.

Eleodendron roxburghii Wt. & Arn.

Ficus benjamina Linn. var. comosa King

Litsea glutinosa (Lour.) C. B. Robins

L. monopetala (Roxb.) Pers.

Mallotus philippensis (Lam.) Muell.-Arg.

Mangifera indica Linn.

Semecarpus anacardium Linn.

Wendlandia heynei Santapau & Merchant

Xylosma longifolium Clos.

#### AN ARTIFICIAL KEY TO THE FAMILIES

Leaves usually reticulately veined. Perianth tetra- or pentamerous. Embryo with two Class I. Dicotyledons Leaves usually parallel veined. Perianth trimerous. Embryo with one cotyledon Class II. Monocotyledons CLASS I. DICOTYLEDONS 1. Leaves simple: 2. Perianth biseriate, i.e. calyx and corolla both distinct: 3. Flowers ploypetalous 4. Torus small or elongated: 5. Stamens indefinite. Leaves large: 6. Gynoecium apocarpous:
7. Leaves upto 90 cm long, dentate. Sepals and petals 5-merous, 1. Dilleniaceae 7. Leaves upto 20 cm long, entire. Sepals and petals 3-merous; petals in two series; sepals not persistent ... 2. Annonaceae 6. Gynoecium syncarpous: 8. Sepals imbricate in bud. Armed trees 3. Flacourtiaceae 8. Sepals valvate in bud: 9. Calyx irregular, adnate to the ovary, lobes enlarged in Dipterocarpaceae 9. Calyx regular, free, lobes not enlarged in fruits: 10. Stamens monadelphous: 11. Leaves lobed. Anthers monothecous. Fruit enclosed 6. Malvaceae 8. Sterculiaceae carpels • • • 10. Stamens free. Fruit drupaceous
5. Stamens definite upto 10. Leaves minute, scale like 9. Tiliaceae 4. Tamaricaceae 4. Torus thickened or expanded into fleshy disc: 12. Calyx imbricate: 13. Plants with schizogenous resin-passages in the bark
13. Plants without resin-passages in the bark
12. Calyx valvate:
Stipules transformed into prickles ... 17. Anacardiaceae 14. Celastraceae 15. Rhamnaceae 4. Disc thin or absent. Ovary usually included in calyx tube: 14. Calyx inferior, free:

## AN ARTIFICIAL KEY TO THE SPECIES

## A. COMPOUND LEAVES

Leaves compound, alternate: 2. Leaves palmately compound: 3. Leaves 3-foliolate; margin crenate:	
4. Trees armed. Leaves gland-dotted. Blaze yellow. Seed numerous, embedded	10 4 1
in mucilaginous pulp 4. Trees unarmed. Leaves not gland-dotted. Blaze pink with crimson juice.	13. Aegle marmelos
Seed 3-4, not embedded in mucilaginous pulp	92. Bischofia javanica
3. Leaves 5-7-foliolate; margin entire;	
Bark covered with conical prickles. Leaflets lanceolate. Flowers scarlet.  Anthers monethecous. Capsule 5-valved, Seed comose	9. Bombax ceiba
2. Leaves pinnately compound:	
5. Leaves imparipinnate: 6. Leaflets 3, stipellate:	
7. Trees armed:	
Bark greenish-grey, exfoliating in papery flakes. Blaze yellow. Flowers	90 75
scarlet	32. Erythrina indica
8. Blaze uniformly red, exudating red juice. Flowers orange-red. Pods	
not articulated. Seed 1 8. Blaze white, streaked blood-red. Flowers white or pale-pink.	29. Butea monosperma
Pods articulated, Seed 2-5	33. Ougeinia
	oojeinensis
<ul> <li>6. Leaflets more than 3, exstipellate:</li> <li>9. Leaflets opposite or sub-opposite:</li> </ul>	
10. Margin crenate-serrate:	
11. Leaflets crenate. Seed winged	15. Garuga pinnata
11. Leaflets serrate. Seed not winged 10. Margin entire:	17. Azadirachta indica
12. Lateral nerves intramarginal:	
Blaze pink, aromatic. Drupe 4 cm long, ovoid, yellow when ripe	27. Spondias pinnata
12. Lateral nerves not intramarginal:	21. орошна ринин
13. Blaze yellowish-green:	
Leaflets 5-9, ovate or elliptic. Flowers white tinged with pink. Seed 1	34. Pongamia pinnata
13. Blaze deep red:	o 1. 1 ongomia pinitara
14. Leaflets 7-9, ovate-oblong; lateral nerves 5-9 pairs.	24 I annea consummablica
Drupe 1.5 cm long, reniform, red when ripe. Seed 1 14. Leaflets 9-17, oblong-lanceolate; lateral nerves 9-16	24. Lannea coromandelica
pairs. Capsule 3 cm long, globular, yellow when ripe.	10 4.1
Seed 3, arillate, aril scarlet	16. Aphanamixis polystachya
9. Leaflets not opposite or sub-opposite:	potystactiya
15. Leaflets 3-5. Bark rough, longitudinally furrowed; blaze	21 Dalharaia sissa
light-brown. Flowers pale-white. Pods pale-brown 15. Leaflets 11-17. Bark smooth, not longitudinally furrowed;	31. Dalbergia sissoo
blaze greenish-grey. Flowers purple, pods purple-brown	30. Dalbergia lanceolaria
5. Leaves paripinnate:	
<ul><li>16. Leaves unipinnate:</li><li>17. Margin of leaflets dentate or minutely spinulose:</li></ul>	
18. Stem unbranched, covered with persistent petiole-bases. Petioles	
spinous. Margin of leaflets spinulose. Fruit drupe, orange-yellow	108. Phoenix sylvestris
18. Stem branched, not covered with the persistent petiole-bases.  Petiole not spinous. Margin of leaflets dentate. Fruit samaroid,	
straw-coloured	14. Ailanthus excelsa
17. Margin of leaflets entire: 19. Leaflets 4-8. Young foliage bright red	23. Schleichera oleosa
19. Leaflets more than 4-8. Young foliage not bright-red:	23. Sumenimera occusa
20. Leaflets 1-2.5 × 0.5-1 cm, linear-oblong:	
Flowers yellow striped with red. Pods with crustaceous brittle epicarp	38. Tamarindus indica
20. Leaslets more than 1-2.5×0.5-1 cm, elliptic-oblong or ovate-	
lanceolate: 21. Bark smooth with horizontal wrinkles; blaze yellow.	
Leaflet elliptic-oblong. Flowers bright yellow. Fruit	
indehiscent, cylindrical. Seed not winged	36. Cassia fistula

15. Flowers small. Fruits 1-2-seeded drupe. Seed large:  16. Leaves over 2.5 cm in breadth. Blaze reddish-brown. Fruit  1-2 cm long, obovate  16. Leaves 2.5 cm or less in breadth. Blaze yellow. Fruit 12×6 mm, oblong-ovoid  14. Leaves not aromatic when bruised:	47. Syzygium cumini 48. Syzygium salicifolium
17. Seed winged: 18. Lateral nerves 5-7 pairs. Flowers white	51. Lagerstroemia parviflora
18. Lateral nerves 10-12 pairs. Flowers purple 17. Seed not winged:	52. Lagerstroemia speciosa
19. Flowers dioecious; petals absent 19. Flowers monoecious; petals present:	91. Trewia polycarpa
<ul> <li>20. Leaves 30-70 cm long. Young leaves when bruised yield red dye: Calyx accrescent in fruit</li> <li>20. Leaves below 25 cm long. Young leaves when bruised not yield red dye:</li> <li>21. Petiole 5-12 cm long:</li> </ul>	78. Tectona grandis
Leaf base cordate. Flowers brownish-yellow 21. Petiole below 3.5 cm long:	76. Gmelina arborea
22. Leaves ovate-lanceolate, glabrous above, stellate- tomentose beneath. Flowers pale-purple 22. Leaves, ovate, glabrous above, pubescent along the	75. Callicarpa arborea
nerves beneath. Flowers greenish-white	77. Premna latifolia var. mucrona <b>t</b> a
<ol> <li>Margin serrate-dentate or crenate:</li> <li>Plants with milky latex. Young branchlets fistular. Blaze cream-colour. Leaves pale-green scabrous above, hispid beneath. Flowers in enclosed receptacles</li> <li>Plants without milky latex. Young branchlets solid. Blaze blood-red. Leaves dark green, glabrous on both surfaces. Flowers white, not enclosed in</li> </ol>	99. Ficus hispida
receptacles	19. Eleodendron roxburghii
<ol> <li>Leaves simple, not opposite:</li> <li>Leaves verticellate:         <ul> <li>Plant wih milky latex. Leaves 3-7 at the nodes; petiole 1.5 cm long with a projection at the base. Fruits follicular. Seed comose on either side</li> </ul> </li> <li>Leaves alternate:         <ul> <li>Margin entire:</li> <li>Latex present:</li> <li>Flowers crowded in globose heads either on or inside fleshy receptacles:</li> <li>Flowers on the inner walls of the closed receptacles:</li> <li>Receptacles axillary, in pairs, sessile:</li> </ul> </li> </ol>	67. Alstonia scholaris
30. Petiole articulated to the blade: 31. Blaze yellow. Ripe receptacles white 31. Blaze not yellow. Ripe receptacles not white:	104. Ficus virens
32. Blaze reddish with milky latex. Lateral nerves 6-9 pairs. Ripe receptacles dark purple 32. Blaze orange with red latex. Lateral nerves 3-6	101. Ficus religiosa
pairs. Ripe receptacles black 30. Petiole not articulated to the blade:	102. Ficus rumphii
<ul> <li>33. Blaze yellow with orange streaks. Leaves 12-18 cm long; lateral nerves 4-6 pairs. Ripe receptacles red</li> <li>33. Blaze pink without orange streaks. Leaves 6-12 cm long; lateral nerves numerous. Ripe receptacles</li> </ul>	97. Ficus benghalensis
orange-yellow	98. Ficus benjamina Var. comosa
29. Receptacles usually on leafless branches:  Blaze pinkish with white latex turning to yellow. Petiole 1.5-4.5 cm long. Receptacles pinkish  28. Flowers on the outer wall of lobulate receptacles:  Book reddich to the party wall of lobulate receptacles:	100. Ficus racemosa
Bark reddish-brown, rough; blaze red. Fruit smooth; orange-red when ripe	96. Artocarpus lakoocha
34. Bark dark-green with vertical cracks; blaze red. Leaves oblong- elliptic; petiole 4-5 cm long. Flowers white	65. Madhuca longifolia var. latifolia
34. Bark ash-coloured without vertical cracks; blaze white. Leaves linear; petiole 1.5 cm long. Flowers bright yellow	69. Thevetia peruviana

Flowers scarlet 77. Fruits not as above : 78. Armed tree :	10. Helicteres isora
Blaze orange, Petiole 8-9 mm long. Drupe red or black 78. Unarmed trees:	5. Xylosma longifolium
79. Bark with vertical furrows:  Leaves dark green above and whitish beneath 79. Bark without vertical furrows:	107. Salix tetrasperma
80. Blaze cream-coloured:  Leaves dark green on both surfaces 80. Blaze pink-coloured:	85. Drypetes roxburghii
81. Lateral nerves 6-8 pairs. On maturity leaves turn to bright yellow. Fruit indehiscent, glabrous, red. Seed 1	64. Embelia tsjeriam-cottam
81. Lateral nerves 9-14 pairs. On maturity leaves turn to coppery red. Fruit dehiscent, 3-lobed. Seed 3	

# ENUMERATION OF THE SPECIES

69.

#### 1. DILLENIACEAE

## 1. Dillenia pentagyna Roxb.

A large deciduous tree. Flowers yellow, cauliflorous. Fruits orange-yellow, fleshy. Common in Sal forests. The flower buds and young fruits are sweet scented. Flowers: March-April; Fruits: May-June; S.K.S. 718. Loc. name: Aggai.

### 2. ANNONACEAE

2. Miliusa tomentosa (Roxb.) Sinclair (Saccopetalum tomentosum Hook. f. & Thoms.) A large deciduous tree. Flowers greenishyellow, leaf-opposed. Petals 6, in 2-series; tered throughout the forests, especially in moist localities. The leaves are aromatic and olive-green, turning to orange-yellow before falling. Flowers and Fruits: April-July; S.K.S. 520.

Loc. name: Kajrauta.

## 3. FLACOURTIACEAE

# 4. Flacourtia indica (Burm. f.) Merr. (F. ramontchii L'Herit)

A small, armed, deciduous tree. Flowers greenish-yellow. Stamens indefinite. Drupes 8 mm long, dark-red or black. Seed 8-14. Frequently found in open forests and grasslands. The plant is seen having large horizontal the outer minute, linear; the inner 3, obtuse, thorns (6 cm long) on the main trunk and saccate at the base. Abundantly found scat- purple petioles and midrib when young.

Flowers: March-April; Fruits: May-June; S.K.S. 599,603.

Loc. name: Kanker.

### 5. Xylosma longifolium Clos.

An evergreen tree, thorny when young. Flowers yellow. Fruit 5 mm long, globose, red or black. Seed 2. Abundantly found along Doma road sides. Flowers: November-January; Fruits: March-April; S.K.S. 530.

Loc. name: Chamarkolha.

#### 4. TAMARICACEAE

### 6. Tamarix dioica Roxb.

A small tree with long spreading and drooping branches. Flowers purple-pink. Capsule 5 mm long, 3-valved. Very common on sandy soils along the river, Little Gandak. Flowers: May-July; Fruits: August-October; S.K.S. 120.

Loc. name: [hau.

#### 5. DIPTEROCARPACEAE

### 7. Shorea robusta Gaertn. f.

A large, semi-deciduous tree. Flowers yellowish. Calyx segments enlarged into 5, unequal, spathulate wings. It is abundantly cultivated in North-West portion of the forest. Flowers: March-April; Fruits: May-June; S.K.S. 19.

Loc. name: Sakhu.

### 6. MALVACEAE

### 8. Kydia calycina Roxb.

A small deciduous tree. Flowers white or pink. Very common in mixed forest. The flowers are sweet scented. Flowers: September-November: Fruits: Cold season; S.K.S. 508.

Loc. name: Pathi.

### 7. BOMBACACEAE

# 9. Bombax ceiba Linn, (B. malabaricum DC.)

A tall deciduous tree. Flowers bright red. Capsule upto 15.6 cm long, 5-angled. Seeds many, enveloped in copious floss.

This is the common silk cotton tree frequently found in mixed and Sal forests. The

bole is straight, cylindrical, butteressed at the base and covered with large conical prickles. The branches are in whorls of 5-7, spreading horizontally. Flowers: February-March; Fruits: April-May; S.K.S. 502.

Loc. name: Semal.

#### 8. STERCULIACEAE

### 10. Helicteres isora Linn.

A shrub or small tree. Flowers scarlet. Fruits: 4-5 cm long, cylindrical, composed of 5 spirally twisted carpels. Not common. Occasionally found in Sal forest. Flowers: August-September; Fruits: October-January, rarely upto June; S.K.S. 540.

Loc. name: Marrorphal.

#### 9. TILIACEAE

# 11. Grewia disperma Rottl. ex Spreng. (G. laevigata auct. plur. non Vahl)

A small tree. Flowers pale-white. Drupes 8 mm in diam., 1-4 lobed, black. Commonly found in moist localities, especially along river banks. Flowers: August-October; Fruits: October-February; S.K.S. 535.

## 12. G. elastica Royle

A large tree. Flowers yellow. Drupes 8 mm in diam., globose, dark purple when ripe. Very common throughout the forest especially along river bank. *Flowers*: April-June; *Fruits*: August-November; S.K.S. 668.

Loc. name: Dhaman.

### 10. RUTACEAE

## 13. Aegle marmelos (Linn.) Correa

A deciduous tree with sharp straight axillary spines. Flowers greenish-white, Fruits 8-20 cm in diam., globose or pyriform. Common in Sal forests. The fruits are of smaller size and contain more mucilage than the cultivated ones. Flowers: March-May; Fruits: March-June; S.K.S. 220.

Loc. name: Bel.

#### 11. SIMAROUBACEAE

## 14. Ailanthus excelsa Roxb.

A large, deciduous tree. Flowers small, greenish-yellow. Fruit 3-5,  $6 \times 1.3$  cm, samaroid, lanceolate. It is a fast growing elegant tree commonly found in mixed forest. The

branches arise in whorls of 6-9. The fruit remains attached for a long time. Flowers: February-April; Fruits: April-June; S.K.S. 885.

Loc. name: Ailansat.

#### 12. BURSERACEAE

### 15. Garuga pinnata Roxb.

A large deciduous tree. Flowers yellow. Drupe yellow, fleshy, pyriform. Seeds winged. Very common in mixed forest. Flowers: March-May; Fruits: May-July, followed by new foliage; S.K.S. 209.

Loc. name: Kikar.

#### 13, MELIACEAE

# 16. Aphanamixis polystachya (Wall.) Parker. [Amoora rohituka (Roxb.) Wt. & Arn.]

A small evergreen tree. Flowers white. Fruits 3 cm long, 3-celled, globular, yellow when ripe. Seeds arillate, aril scarlet. Abundantly found along the river and Doma roadsides. The dehisced capsules, with scarlet arillate seeds are abundantly seen along roadsides during monsoon. Flowers: August-November; Fruits: December-July; S.K.S. 549.

Loc. name: Athara.

# 17. Azadirachta indica A. Juss. (Melia azadirachta Linn.)

A deciduous tree. Flowers white. Drupe 1.5 cm long, greenish-yellow when ripe. Rare, a few plants are seen along Doma road-sides. Flowers: March-May; Fruits: May-July; S.K.S. 71.

Loc. name: Neem.

# 18. Toona ciliata Roem. (Cedrela toona Roxb, ex Rottl. & Willd.)

A large deciduous tree. Flowers cream colour. Fruit 2 cm long, capsular, darkbrown. Seeds reddish-brown, with membranous wings on either end. Abundantly found in mixed forest. The dehisced capsules persist for a long period on the tree. Flowers: March-April; Fruits: June-July; S.K.S. 85,112.

Loc. name: Toon.

#### 14. CELASTRACEAE

# **19. Eleodendron roxburghii** Wt. & Arn. [E. glaucum auct. (non Pers.)]

A medium-sized tree, forming dense crown. Flowers white, in axillary dichotomously branched cymes. Fruit 1.5 cm long, yellow-ish-green, tipped with persistent style. Rarely found inside the forest: Flowers: April-June; Fruits: January-June; S.K.S. 414.

Loc. name: Mutmur.

#### 15. RHAMNACEAE

# **20. Zizyphus mauritiana** Lam. (Z. jujuba Lam. non Mill.)

A medium-sized, deciduous tree; young parts pubescent. Flowers greenish-yellow. Drupes 1.5 cm in diam., globose, yellow or red. Abundantly found in grasslands. Flowers: September-November; Fruits: November-March; S.K.S. 331.

Loc. name: Ber.

## 21. Z. rugosa Lam.

A medium-sized, evergreen tree. Flowers greenish. Drupes 1 cm in diam., globose or pyriform, white when ripe. Abundantly found in grasslands. *Flowers*: March-May; *Fruits*: April-July; S.K.S. 449.

## 22. Z. xylopyrus (Retz.) Willd.

A small tree. Flowers greenish-yellow. Drupe 1-2.5 cm in diam., woody, deep green when ripe. Common in mixed forest. Flowers: April-June; Fruits: October-December; S.K.S. 223.

Loc. name: Chittaina.

### 16. SAPINDACEAE

# 23. Schleichera oleosa (Lour.) Oken (S. trijuga Willd.)

A large handsome tree. Flowers yellowish-green. Fruit 1 × 1.8 cm globose, apiculate, dry. Frequently found in Sal and mixed forests. It presents a most singular appearance with bright-red young foliage during April-May. Flowers: March-April; Fruits: October-November; S.K.S. 74.

Loc. name: Kusum.

#### 17. ANACARDIACEAE

# 24. Lannea coromandelica (Houtt.) Merr. (Odina wodier Roxb.)

A deciduous tree. Flowers greenish-yellow. Drupes 1.4 cm long, reniform, red when ripe. Very common throughout the forest. The flowers appear when the plant is leafless. The leaves are green, turning to yellow before falling. Flowers: March-April; Fruits: April-June; S.K.S. 128, 662.

Loc. name: Jigna.

## 25. Mangifera indica Linn.

A large, evergreen tree. Flowers yellowish-green. Drupes 2-15 cm long, ovoid, yellowish or reddish. Common in Sal forest along road sides. The tree is largely attacked by the semi-parasite *Dendrophthoe falcata* (Linn. f.) Etting. *Flowers*: January-March; Fruits: March-July; S.K.S. 778.

Loc. name: Aam.

## 26. Semecarpus anacardium Linn. f.

A small, medium-sized tree. Flowers greenish-white. Drupe 3 cm long, compressed, shining, black when ripe, seated on an orange-coloured fleshy receptacle. Fairly common, scattered throughout as a constituent of the under-storey of sal forest. Flowers: June-August; Fruits: August-October; S.K.S. 780.

Loc. name: Bhilva.

# 27. Spondias pinnata (Linn. f.) Kurz (S. mangifera Willd.)

A small, deciduous tree. Flowers greenish-white. Drupes 4 cm long, ovoid or oblong, yellow when ripe. Rare; found in Sal forest. Flowers appear when the plant is leafless. The leaves are dark green, turning bright-yellow before falling. Flowers: March-April; Fruits: May-August; S.K.S. 35.

Loc. name: Amra.

## 18. MORINGACEAE

# 28. Moringa oleifera Lam. (M. pterygosperma Gaertn.)

A small or large deciduous tree. Flowers white. Capsule 20-45 cm long, linear, pendulous, 9-ribbed longitudinally. Seeds 3-gonous,

winged. Rarely found in the forest. Flowers: January-March; Fruits: April-June; S.K.S. 39.

Loc. name: Sahzan.

#### 19. PAPILIONACEAE

# 29. Butea monosperma (Lam.) Taub. (B. frondosa Koenig ex Roxb.)

A medium-sized, deciduous tree. Flowers orange-red, fascicled into dense racemes, on leafless branches. Pod 10-16×4-6 cm, pendulous, silky tomentose, 1-seeded. Seeds oval, dark brown. Very common in Sal forest. Flowers: March-April; Fruits: May-July; S.K.S. 217.

Loc. name: Palas.

## 30. Dalbergia lanceolaria Linn. f.

A small deciduous tree. Flowers purple. Pod 3-6×2 cm, purple-brown, 1-3 seeded. Seed reniform. A common constituent of Sal forest. The flowers are showy and appear when the tree is leafless. Flowers: AprilJune; Fruits: September-October; S.K.S. 146.

#### 31. D. sissoo Roxb.

A large tree. Flowers pale-white. Pod 4-7 × 0.6-1 cm, strap-shaped, pale-brown. Seeds 2-3. Very common throughout the area particularly in Sal forest. Flowers: February-April; Fruits: November-February; S.K.S. 190.

Loc. name: Shisham.

### 32. Erythrina indica Lam.

A medium-sized, armed tree. Flowers bright scarlet. Very common throughout the sal and mixed forests. It gives a touch of colour to the forest when in full bloom. Flowers: March-April; S.K.S. 113.

## 33. Ougeinia oojeinensis (Roxb.) Hochr.

A medium-sized, deciduous tree. Flowers light-pink. Pods 4-8 × 0.8 cm, jointed. Rare, only few plants seen in sal forests. Flowers: February-May; Fruits: May-June; S.K.S. 21.

Loc. name: Panan.

### 34. Pongamia pinnata (Linn.) Pierre

A middle-sized evergreen tree. Flowers

white tinged with pink. Pod 6-10×2-3 cm thick woody, 1-seeded. Flowers: March-June; Fruits: throughout the year; S.K.S. 212.

Loc. name: Dithori.

#### 20. CAESALPINIACEAE

### 35. Bauhinia purpurea Linn.

A small tree. Flowers deep purple. Calyx 2-cleft. Pod linear, pointed at both the ends. Rare, only a few plants seen planted near the rest houses. The trees are beautiful when in flowers. Flowers: September-December; Fruits: December-March; S.K.S. 581.

Loc. name: Kachnar.

#### 36. Cassia fistula Linn.

A medium-sized tree with drooping branches. Flowers bright yellow. Pods 32-49×2-2.2 cm, cylindrical, dark-brown when ripe. Seeds embedded in yellow pulp. parallel with septa. Common in Sal forest. Beautiful bright yellow flowers appear when the tree is leafless. Flowers: March-July; Fruits: Winter season; S.K.S. 216.

Loc. name: Amaltas.

# 37. Piliostigma malabaricum (Roxb.) Benth. (Bauhinia malabarica Roxb.)

A deciduous tree. Flowers dull-white. Calyx 5-cleft, tomentose. Pod flexible beaked. Seed ovoid-globose, polished dark-brown. Common throughout the forest. The leaves are acidic in taste—a character of specific importance. Flowers: September-November; Fruits: December-March; S.K.S. 461.

Loc. name: Sahoul.

## 38. Tamarindus indica Linn.

A deciduous tree with dense crown. Flowers yellow striped with red. Stamens 3. Pods 8-15×1.5-2 cm, indehiscent, with crustaceous brittle epicarp and thick pulpy mesocarp. Seeds dark brown, smooth, shining. Rarely found scattered in Sal forest. The yield of fruits is very poor. Flowers: July-November; Fruits: December-March; S.K.S. 200. Loc. name: Imili.

21. MIMOSACEAE

## 39. Acacia catechu (Linn. f.) Willd.

A moderate-sized deciduous tree. Flowers white, fading to pale-brown. Pods 5-7.5 cm long, strap-shaped, dark-brown, dehiscent. Abundantly found throughout the forests. Flowers: August-October; Fruits: November-February; S.K.S. 314.

Loc. name: Khaira.

# 40. Albizzia lebbeck (Linn.) Benth.

A large deciduous tree. Flowers greenishwhite. Pods 12-22 × 3-4 cm, glabrous, straw-coloured. Seeds 4-12, brown. Common in Sal forest. The pods remain persistent for a long period. Flowers: April-May; Fruits: November-March; S.K.S. 131.

Loc. name: Siris.

## 41. A. procera (Roxb.) Benth.

A large graceful tree. Flowers yellowish green. Pods 10-15×2 cm, reddish-brown. Seeds 6-12, pale-brown. Very common throughout the forests, especially along Doma road-sides. Flowers: May-July; Fruits: Cold season; S.K.S. 80.

Loc. name: Safed-siris.

# **42. Pithecolobium dulce** (Roxb.) Benth. (Inga dulcis Willd.)

A thorny shrub or tree. Flowers white in axillary heads. Pods spirally twisted, reddish when ripe. Seeds black, shining, covered with white spongy edible aril. Uncommon. A few trees are seen along the road sides. Flowers: January-February; Fruits: April-May; S.K.S. 178.

Loc. name: Jangli-jalebi.

### 22. COMBRETACEAE

# 43. Terminalia alata Heyne ex Roth (T. tomentosa Wt. & Arn.)

A large deciduous tree. Flowers dullyellow, sessile in terminal tomentose panicles. Fruits 5×4 cm, 5-winged, wings coriaceous with crenulate edge, dark brown. Very common in Sal forest, especially along roadsides. Flowers: July-August; Fruits: November-March; S.K.S. 186.

Loc. name: Asna.

### 44. Terminalia bellirica (Gaertn.) Roxb.

A large deciduous tree. Flowers greenishyellow in slender axillary and extra-axillary interrupted drooping spikes. Fruits 3×2 cm, ovoid, tomentose, brown, not winged. Abundantly found throughout the forest, also in grasslands. Large umbragenous crown and buttressed base are characteristic. Flowers: April-June; Fruits: December-February; S.K.S. 661.

Loc. name: Bahera.

### 45. T. chebula Retz.

A medium-sized, deciduous tree. Flowers dull-white, in terminal or axillary panicled spikes. Fruits 2.5-4×1.5 cm, obovoid or ellipsoid, drupaceous, 5-ribbed when dry. Common in Sal forest. The flowers appear with new foliage. Flowers: April-March; Fruits: December-February; S.K.S. 213. Loc. name: Harra.

#### 23. MYRTACEAE

## 46. Psidium guajava Linn.

A medium-sized tree. Flowers white. Fruit many seeded berry. Frequent in swamp forest. The fruits are of inferior quality and are generally eaten by birds, monkeys and children. Flowers: April-June; Fruits: July-August and November-January; S.K.S. 853.

Loc. name: Amrood.

# 47. Syzygium cumini (Linn.) Skeels (Eugenia jambolana Lam.)

A medium-sized or large evergreen tree. Flowers greenish-white, small, subsessile in trichotomous panicles. Fruit 1-2 cm long, obovate, black with dark-purple juice. Seed one. It is abundantly found in swamp forest, chiefly mixed with Barringtonia acutangula (Linn.) Gaertn., Ficus racemosa Linn., Salix tetrasperma Roxb., Xylosma longifolium Clos. Flowers: May-June; Fruits: June-July; S.K.S. 871.

Loc. name: Jamun.

### 48. S. salicifolium Grah.

A small tree. Flowers greenish-white, small, sessile or sub-sessile in small heads at

the ends of branches or cymes. Fruit 12 × 6 mm, oblong-obovoid. Seed one. Gregarious and abundant along the bank of rivers and tals. *Flowers*: March-June; *Fruits*: July-August; S.K.S. 929.

Loc. name: Kathjamunia.

### 24. LECYTHIDACEAE

# 49. Barringtonia acutangula (Linn.) Gaertn.

A small glabrous tree. Flowers scarlet, pendulous, many-flowered racemes, 15-32 cm Fruits 2-4 cm long, quadrangular, by the persistent calyx-lobes. crowned Abundant in swamp forest, generally in association with Bischofia javanica Bl., Ficus semicordata Buch.-Ham. ex J. E. Sm., Syzygium cumini (Linn.) Skeels, Trewia polycarpa Benth., etc. The trunk gives a rugged appearance with crowded leaves at the end of the branches. The flowers are small but as they grow in pendulous raceme, they render beauty to the plant. Flowers: April-July; Fruits: September-October; S.K.S. 425.

Loc. name: Paniha, Ijar.

## 50. Careya arborea Roxb.

its: A moderate-sized deciduous tree. Flowers W.S. white and pink in clusters of 4-6, at the ends of the branches. Fruits 6-8 cm long, globular, crowned with persistent calyx-limb and style. Seeds numerous, immersed in pulp. Very common in Sal and teak forests, especially along road-sides. The flowers are bad in smelling and appear when the tree is leafless. Dag, Leaves turn red or purple before falling. Seed Flowers: March-April; Fruits: July; S.K.S. rest, 934.

Loc. name: Kumbhi.

### 25. LYTHRACEAE

### 51. Lagerstroemia parviflora Roxb.

A large deciduous tree. Flowers white. Capsule 1.5-2.5 × 1-2 cm, ovoid or ellipsoid. Seeds 1-1.8 cm long, winged. Very common in Sal forest. In juvenile plants, the leaves are very large resembling that of *Holarrhena* 

antidysenterica Wall. Flowers: May-July; Fruits: Cold season; S.K.S. 253, 446.

Loc. name: Ashidh.

# **52.** Lagerstroemia speciosa (Linn.) Pers. (L. flosreginae Retz.)

A medium-sized tree. Flowers purple. Capsule 1.8-2.8 × 1.2 cm, seated on woody, thickened, ribbed calyx. Seeds 1-1.4 cm long, winged. Rare. Only a few plants seen along the river and roads. The tree looks beautiful when in flowers. Flowers: June-October; Fruits: September-March; S.K.S. 254.

#### 26. SAMYDACEAE

# **53.** Casearia elliptica Willd. (C. tomentosa Roxb.)

A small deciduous tree. Flowers greenishyellow. Capsule 1-2.5 × 0.7-1.5 cm, yellow when ripe. Seeds embedded in red pulp. Very common in teak forest, also on outskirts of Sal forest. Flowers: March-May; Fruits: April-May; S.K.S. 602.

Loc. name: Beri.

### 27. ALANGIACEAE

## 54. Alangium salvifolium (Linn. f.) Wang.

A small deciduous tree. Flowers white. Fruits 2:5 × 1.4 cm, crowned with persistent calyx-limb, black when ripe. Very common along the river. Flowers and buds largely eaten by baboon. Flowers: March-May; Fruits: June-August; S.K.S. 83, 300.

Loc. name: Akola.

### 28. RUBIACEAE

# **55.** Adina cordifolia (Roxb.) Benth. & Hook. f. ex Brandis.

A tall deciduous tree. Flowers yellow, in globose peduncled heads. Capsules numerous in each head. Seeds oblong, winged. Fairly abundant throughout the forest. The leaves are dark green, curved downward on either-side and bear several dark brown spots before falling. Flowers: June-August; Fruits: Cold season; S.K.S. 247.

Loc: name: Haldu.

# **56.** Anthocephalus chinensis (Lam.) A. Rich. ex Walp.

A large tree. Flowers orange, in solitary globular heads. Fruits 5 cm across, yellow. Common along river banks. The branches are in whorls. Flowers: June-July; Fruits: August-September; S.K.S. 900.

Loc. name: Kadamb.

## 57. Hymenodictyon excelsum (Roxb.) Wall.

A medium-sized deciduous tree. Flowers greenish-white, in large terminal panicles of spikes. Capsule 2-valved, ellipsoid, reddish-brown, dehiscent. Seeds lenticular, winged around the margin. Common throughout the forest. Flowers: May-July; Fruits: Cold season; S.K.S. 727.

Loc. name: Bhurkur.

# 58. Hyptianthera stricta (Roxb.) Wt. & Arn.

A small evergreen tree. Flowers white, in axillary fascicles. Berries 5-7 mm, crowned by the persistent calyx. Fairly common in damp and shady places, especially along river-banks. Flowers: April-May; Fruits: February-March; S.K.S. 450.

# **59.** Ixora arborea Roxb. ex Sm. (I. parviflora Vahl, non Lam.)

A small evergreen tree. Flowers white. Fruits 5-7 mm, shining, black. Very common all over the Sal forest in damp and dry situations. The plant looks very elegant with masses of white terminal flowers. A large number of bees are seen around the sweet scented flowers. Flowers: March-May; Fruits: April-June; S.K.S. 915.

#### 60. Mitragyna parvifolia (Roxb.) Korth.

A large deciduous tree. Flowers light yellow in globose heads. Fruits in head consisting of small, ribbed, 2-valved capsules. Seeds numerous, winged. Common along river banks and in open forest. Flowers: May-July; Fruits: Cold season; S.K.S. 218, 800.

Loc. name: Tikui.

# 61. Wendlandia heynei (R. & S.) Santapau & Merchant [W. exserta (Roxb.) DC.]

A small deciduous tree. Flowers dull-white in large conical terminal panicles of cymes. Capsule 2 mm long, white-tomentose. Seeds minute, black. Fairly abundant in mixed

forest, especially along Doma-road sides. The leaves turn purple before falling. Flowers: March-April; Fruits: April-July; S.K.S. 917.

62. Xeromphis spinosa (Thunb.) Keay [Randia dumetorum (Retz.) Poir]

A small tree with strong, straight, decussate spines, 2.5-4 cm long. Flowers greenishwhite, 1-3 at the end of short lateral branchlets. Fruits  $4.5 \times 2.5$  cm, glabrous, yellow when ripe. Seeds numerous, imbedded in a gelatinous pulp. Abundant throughout the forest. The flowers are white in the beginning turning to yellow with age. Flowers: April-June; Fruits: November-April; S.K.S. 150, 537.

Loc. name: Mainphal.

# 63. X. uliginosa (Retz.) Maheshwari (Randia uliginosa DC.)

A rigid small tree with thick woody 4angled branches. Flowers white, solitary, 3.5 cm in diam., fragrant. Fruits 5-6 cm in diam., ellipsoid, smooth yellowish crowned by the persistent calyx-lobes. Common in open forest. The leaves are crowned at the ends of the branches. The main trunk is covered with strong and sharp spines. Flowers are showy and fragrant. Flowers: May-June; Fruits: September-December; S.K.S. 921.

Loc. name: Pindar.

### 29. MYRSINACEAE

### 64. Embelia tsjeriam-cottam A. DC.

A small tree with lenticellate branches. Flowers greenish-yellow, small, in axillary or terminal simple or fascicled racemes. Fruit globose, red. Abundant in Sal forest, chiefly along road-sides, forming an understorey. Flowers: April-July; Fruits: November-February; S.K.S. 647.

Loc. name: Baibrang.

### 30. SAPOTACEAE

# 65. Madhuca longifolia (Koenig) Mac Bride var. latifolia (Roxb.) Chev.

A large deciduous tree. Flowers creamcoloured, clustered at the ends of the branches. Fruits 2.5-5 cm long berries, 1-4 seeded. Seeds dark brown, shining. Commonly found in Sal forest. *Flowers*: March-May; *Fruits*: June-August; S.K.S. 121.

Loc. name: Mahua.

#### 31. EBENACEAE

# 66. Diospyros exsculpta Buch.-Ham. (D. tomentosa Roxb.)

A small deciduous tree. Flowers dull-white, dioecious. Male flowers in cymes. Calyx funnel-shaped. Corolla-lobes twisted, villous. Female flowers solitary, larger. Common in Sal forest. Flowers: April-June; S.K.S. 219.

Loc. name: Tendu.

#### 32. APOCYNACEAE

## 67. Alstonia scholaris (Linn.) R. Br.

A tall evergreen tree. Flowers greenish-white, in compact umbellate cymes. Fruits 25-40 cm long terete paired follicles, hanging in clusters. Seeds many, flattened, hairy on either side. Only a few plants seen on the river banks and Doma-road sides. Flowers: November-January; Fruits: March-June; S.K.S. 537.

### 68. Holarrhena antidysenterica (Roth) A. DC.

A small deciduous tree. Flowers white. Fruits of 2, divaricate follicles. Abundantly found in Sal forest. Flowers: May-July; Fruits: Cold season; S.K.S. 221.

Loc. name: Kurchi.

## 69. Thevetia peruviana (Pers.) L. Schum.

A small evergreen tree. Flowers yellow. Fruits drupaceous, broader than long, bluntly 4-angled. Cultivated near the temple but few plants are seen as escapes in Sal forest. Flowers and Fruits: Throughout the year; S.K.S. 87.

### 33. ASCLEPIADACEAE

### 70. Calotropis gigantea (Linn.) R. Br.

A small tree. Flowers light purple. Corollalobes spreading. Follicles 7-10×3 cm, recurved, fleshy. Seeds numerous, black, flat with a bright silky-white coma. Abundant in grasslands and along the river embankments. Flowers: December-August; Fruits: February-June; S.K.S. 208.

#### 34. BORAGINACEAE

#### 71. Cordia dichotoma Forst, f.

A small deciduous tree. Flowers white. Drupes upto 2.5 cm long, ovoid, apiculate, yellow, subtended by the enlarged and hardened calyx. Abundant throughout the area, chiefly along river banks. The leaves when bruised have a characteristic smell. Flowers: March-May; Fruits: July-September; S.K.S. 678.

Loc. name: Lasora,

### 72. Ehretia laevis Roxb.

A small deciduous tree with spreading crown. Flowers white. Drupes 5 mm, globose, 2-lobed, deep red, with 1-4 seeded pyrenes. Frequent in Sal forest. The bruised leaves and blazed bark have a peculiar offensive smell resembling that of Holoptelca integrifolia (Roxb.) Planch. Flowers: January-March; Fruits: February-April; S.K.S. 800.

Loc. name: Datranga.

#### 35. BIGNONIACEAE

# 73. Haplophragma adenophyllum (Wall.) P. Dop.

A large tree with dense crown. Flowers yellowish-brown. Capsule 30-50 × 3 cm, cylindrical, ribbed, rusty-tomentose. Seeds winged. A rare tree, only a few plants seen in Sal forest. Flowers: September-November; Fruits: October-February; S.K.S. 269.

### 74. Oroxylum indicum (Linn.) Vent.

A small deciduous tree. Flowers large, dark purple, fleshy, malodorous. Capsule 40-60 × 6-8 cm, flat, oblong, narrowed on either ends. Seeds 4 × 6 cm, numerous, silvery white. Frequently found in Sal forest. Flowers: July-October; Fruits: October-June; S.K.S. 809.

## 36. VERBENACEAE

# 75. Callicarpa arborea Roxb.

A small tree. Flowers pale-purple, in dichotomous corymbose cymes. Drupes 2 mm long, purple, seated on the small spreading calyx. Very common in swamp forest. Flowers: April-June; Fruits: August-November; S.K.S. 657.

#### 76. Gmelina arborea Roxb.

A medium-sized deciduous tree. Flowers brownish-yellow, in panicles. Drupe 2 cm long, yellow when ripe. Common throughout the forest chiefly in grasslands. Flowers: March-May; Fruits: May-June; S.K.S. 639. Loc. name: Kambhar.

# 77. Prema latifolia Roxb. var. mucronata (Roxb.) C. B. Clarke

A small or medium-sized deciduous tree. Flowers greenish-white. Drupes dark purple. Frequent on the margins of Sal forest. The leaves before shedding turn black and emit an unpleasant smell when bruised. Flowers and Fruits: April-August; S.K.S. 675.

## 78. Tectona grandis Linn. f.

A large deciduous tree; branchlets 4-angular, stellately tomentose. Flowers white. Abundant. The main constituents of teak are Careya arborea Roxb., Flacourtia indica (Burm. f.) Merrill, Streblus asper Lour. etc. Flowers: July-August; Fruits: October-December; S.K.S. 369.

Loc. name: Sagon; Teak.

### 37. LAURACEAE

### 79. Beilschmiedia roxburghiana Nees

A medium-sized evergreen tree. Flowers yellowish-green. Fruits 4.5 cm long, oblong-obovoid, dark purple when ripe. Commonly found in moist situations forming the middle storey of Sal forest. Flowers: April-May; Fruits: Rainy season; S.K.S. 710.

# 80. Litsea glutinosa (Lour.) C. B. Robinson (L. chinensis Lam.)

A medium-sized evergreen tree. Flowers yellowish-green. Fruits globose, black, supported by thickened, club-shaped perianth tube. Abundant in swampy places. Leaves turn black at maturity. Flowers: April-July; Fruits: Winter season; S.K.S. 573, 664.

Loc. name: Medh.

# **81.** L. monopetala (Roxb.) Pers. (L. polyantha Juss.)

A small tree. Flowers greenish-yellow. Fruits ovoid, black, seated on the small sub-cupular perianth. Common in swamp forest.

Leaves aromatic when bruised. Flowers: March-June; Fruits: June-September; S.K.S. 597.

#### 38. EUPHORBIACEAE

## 82. Antidesma ghesaembilla Gaertn.

A small deciduous tree. Flowers greenishyellow, dioecious, in densely pubescent, terminal or axillary panicled spikes. Drupe  $4 \times 3$  mm, red finally black when ripe. Frequent in grasslands. Flowers: April-June; Fruits: Cold season; S.K.S. 222.

Loc. name: Banmasuria.

### 83. Bridelia retusa Linn.

A medium-sized deciduous tree with strong, horizontal, conical spines 4 cm long Flowers greenish-yellow, in when young. axillary clusters which in turn are arranged in spikes. Fruits 6-10 mm in diam., globose, purplish-black with persistent calyx. Abundant in Sal forest. The main trunk is largely attacked by white ants. Flowers: August-Fruits:October; Cold season; S.K.S. 291, 409.

Loc. name: Khaja.

## 84. Croton roxburghii Bal.

A small deciduous tree. Flowers yellowishgreen, on long terminal racemes. Capsules 1-1.2 cm, 3-grooved, covered with scales. Seeds ellipsoid, smooth, brown. Abundantly found scattered all over the Sal forest. The leaves turn coppery red before falling. Flowers: February-March; Fruits: April-May; S.K.S. 701.

Loc. name: Lapkan.

# 85. Drypetes roxburghii (Wall.) Hurusawa (Putranjiva roxburghii Wall.)

A medium-sized evergreen tree with pendent branches. Flowers yellow, dioecious. Fruit 1 cm long, ellipsoid, white-tomentose, pointed at both ends. Fairly common in swamp forest. Flowers: March-May; Fruits: November-March; S.K.S. 65.

Loc. name: Nizzia, Putra-jiva.

# 86. Emblica officinalis Gaertn. (Phyllanthus emblica Linn.)

A moderate-sized deciduous tree. Flowers greenish-white or yellow, in axillary fascicles.

Fruits 1-3 cm in diam., greenish-yellow, fleshy with 6-vertical faint furrows. Seeds 6, trigonous. Not common; occasional specimens found scattered throughout the area. Flowers: February-May; Fruits: Cold season; S.K.S. 734.

Loc. name: Aonla.

# 87. Glochidion lanceolarium Voigt. non. Dalz.

A small or medium-sized evergreen tree. Flowers pale-green, in axillary clusters. Capsule 2 cm in diam., orbicular, 6-8 lobed. Fairly common in Sal forest, chiefly in moist localities. Flowers: December-February; Fruits: Summer season; S.K.S. 729.

## 88. Mallotus philippensis (Lam.) Muell.-Arg.

A small tree. Flowers yellowish-brown, in spikes. Capsule 6-12 mm, 3 lobed, covered with a crimson powder. Seeds smooth, black. Abundant in Sal forest forming middle storey, along with Alangium salvifolium (Linn. f.) Wang., Streblus asper Lour., etc. Flowers: September-November; Fruits: March-May; S.K.S. 46.

Loc. name: Roina.

# 89. Melanthesa rhamnoides (Retz.) Bl. (Breynia rhamnoides Muell.-Arg.)

A small tree. Flowers greenish-yellow on filiform pedicels. Fruits 6 mm, smooth, dull-red or purple. Fairly abundant in mixed forest. The leaves are dark green above and pale beneath, turning black when dry. Flowers and Fruits: April-October; S.K.S. 69.

# 90. Securinega virosa (Roxb. ex Willd.) Pax & Hoffm. (Fluggea microcarpa Blume).

A small glabrous tree. Flowers greenish, small, in axillary fascicles. Fruits globose, white with a fleshy pericarp. Not very common; occasional plants seen in open forest. Flowers and Fruits: April-August; S.K.S. 974.

# 91. Trewia polycarpa Benth. (T mudiflora Linn.)

A middle-sized deciduous tree. Flowers pale-green, dioecious. Male flowers in pendulous racemes. Female flowers solitary or

2-3 together. Fruits upto 3.5 cm in diam., drupaceous, green. Very common in swamp forest. The plant is often confused with Gmelina arborea Linn. Flowers: February-April; Fruits: Cold season; S.K.S. 245.

Loc. name: Bahlol.

### 39. BISCHOFIACEAE

### 92. Bischofia javanica Bl.

A large semi-deciduous tree. Flowers greenish, dioecious, in axillary panicled racemes. Fruits 6 mm, globose, berries, brown or black when ripe. Seeds 3-4, smooth. Very common in swamp forest. Leaves turn red before falling. Flowers: April-May; Fruits: Cold season; S.K.S. 908.

Loc. name: Mircha, Sahul.

#### 40, ULMACEAE

## 93. Celtis tetrandra Roxb.

A medium-sized deciduous tree with drooping branches. Flowers yellowish-green, in axillary cymes. Drupe 7 mm long, ellipsoid, orange-red when ripe. Very common in mixed forest as a constituent of middle storey. Flowering starts with new leaves. Flowers: February-March; Fruits: October-November; S.K.S. 961.

### 94. Holoptelea integrifolia (Roxb.) Planch.

A large deciduous tree, buttressed at the base. Flowers greenish, in numerous fascicles on the leafless branches. Fruits 2.5 × 2 cm, samaroid, oval or orbicular; wing reticulately veined. Sporadically found in Sal forest. Flowers: February-March; Fruits: March-June; S.K.S. 969.

### 95. Trema orientalis (Linn.) Blume

A small tree with spreading branches. Flowers greenish, in axillary pubescent cymes. Drupes 3 mm, ovoid, black when ripe with persistent calyx. Frequently found along the river. Flowers and Fruits: Almost throughout the year; S.K.S. 184, 505.

### 41. MORACEAE

### 96. Artocarpus lakoocha Roxb.

A large deciduous tree. Flowers yellow, in axillary, sub-sessile heads. Male receptacles

2.5 cm long, spongy, caducous. Female receptacles 5-8 cm, lobulate, orange-red when ripe. Rare. Leaves turn bright red before falling. *Flowers*: March-April; *Fruits*: Rainy season; S.K.S. 911.

Loc. name: Barhal.

### 97. Ficus benghalensis Linn.

A large evergreen tree with numerous aerial roots from the branches. Receptacles upto 1.6 cm in diam., sessile, red when ripe. Fairly common throughout the area. Receptacles: March-July; S.K.S. 780.

Loc. name: Bargad.

## 98. F. benjamina Linn. var. comosa King

A large handsome, umbragenous tree with drooping branches and aerial roots. Receptacles 2.5 × 1.5 cm, solitary or paired, subsessile, orange-yellow when ripe. Very rare; only one tree seen in swamp forest. Receptacles: March-June; S.K.S. 628.

## 99. F. hispida Linn. f.

A moderate-sized tree with hollow branches. Receptacles 1-2.8 cm long, turbinate, in pairs from leaf axils (young branches) or in fascicles on leafless branches, greenish-yellow when ripe. Frequently found scattered throughout the area; chiefly in moist situations. Receptacles: Throughout the year; S.K.S. 166, 294, 365.

Loc. name: Kathgularia.

# 100. F. racemosa Linn. (F. glomerata Roxb.)

A large deciduous tree, buttressed at the base. Receptacles 3.2 × 3.5 cm, top-shaped, red or pink when ripe, clustered on leafless branches usually on main trunk. Receptacles: April-July; S.K.S. 580.

Loc. name: Gular.

## 101, F. religiosa Linn.

A large deciduous tree. Receptacles 10× 8 mm, sessile, paired, dark-purple when ripe. Frequent throughout the area. Receptacles: April-May and August-November; S.K.S. 102.

## 102. F. rumphii Blume

A large deciduous tree. Receptacles 15×

14 mm, sessile, in axillary pairs, whitish with dark spots when ripe. Frequent in swamp forest, chiefly along the river, associated with Barringtonia acutangula Gaertn. and Ficus racemosa Linn. Receptacles: April-June; S.K.S. 466.

Loc. name: Gajahar.

103. Ficus semicordata Buch.-Ham. ex J. E. Smith (F. cunea Buch.-Ham. ex Roxb.)

A medium-sized or large tree with spreading branches. Receptacles 2 cm across, pyriform, verrucose, in pairs or fascicled on the base of trunk or on leafless panicled racemes, reddish-brown when ripe. Frequent in swamp forest. Receptacles: Throughout the year; S.K.S. 107.

104. F. virens Ait (F. infectoria Roxb. non Willd.)

A large deciduous tree with few aerial roots. Receptacles 6-10×6-8 mm, sessile, in axillary pairs, tubercled, white when ripe. Common throughout the area. Receptacles: August-October; S.K.S. 127.

## 105. Morus alba Linn.

A small deciduous tree. Flowers monoecious, on short ovoid spikes. Female spikes, purplish-black when ripe. Rare; only a few plants seen along Doma-road side. Flowers: February-March; Fruits: April-June; S.K.S. 919.

### 106. Streblus asper Lour.

A rigid, small, often gnarled, evergreen tree. Flowers yellowish-green, dioecious. Fruits 5 mm, globose, baccate, enclosed by the accrescent calyx, yellow when ripe. Abundant in grassland and in moist places. Flowers: February-April; Fruits: May-July; S.K.S. 951.

Loc. name: Singhore.

## 42. SALICACEAE

## 107. Salix tetrasperma Roxb.

A moderate-sized tree. Leaves 4-12 × 1-2.5 cm, oblong lanceolate, serrulate, green above, white beneath. Common along the river banks near 'Ledi bridge'. The plants are characterised by drooping, silky white

branchlets. The chief undergrowths are Barringtonia acutangula Gaertn., Calamus tenuis Roxb. and Ficus heterophylla Linn. f. S.K.S. 907.

### 43. PALMACEAE

# 108. Phoenix sylvestris (Linn.) Roxb.

A tall palm upto 15 m high with hemispherical crown. Trunk rough, covered with persistent petiole bases. Male flowers white. Fruits oblong-ellipsoid, orange-yellow. Very common in grasslands. Flowers: January-March; Fruits: April-June; S.K.S. 190.

#### 44. GRAMINEAE

## 109. Bambusa arundinacea Retz.

A tall thorny bamboo. Culms 20-35 m high, 10-18 cm in diam., with almost leafless horizontal armed branches. Spikelets usually 5 in a cluster, 8-25 mm long, lanceolate. Caryopsis 5-8 × 2 mm, oblong. Gregarious in teak forest and grasslands. Flowers and Fruits: April-June; S.K.S. 494.

Loc. name: Bans.

### ACKNOWLEDGEMENT

The authors are thankful to Professor K. S. Bhargava, Head of the Botany Department and Dean, Faculty of Agriculture, University of Gorakhpur for providing necessary facilities and encouragement.
